Haystaq National Models User Guide 2021

L2 National Models User Guide

Haystaq is excited to announce our national political models, updated for 2021. Each of the 200 million voters on the L2 voter file has a score representing their likelihood of agreeing with any of 120 given positions, now updated to include a new set of contemporary issues: Trump and Pence approval and disapproval, support for Republican tax reform efforts, concern about the Trump campaign's interactions with Russia, and support for the impeachment of President Trump.

These models were built using response data from a national custom-built survey fielded via IVR- and live- telephone calls, text surveys and an online panel in summer of 2021. The indicator data used by these models is a combination of individual-level voter registration information and past voting behavior, individual and household demographic and consumer characteristics, and census and geographic-level data.

For all models, we exclude a random ⅓ sample of the survey data from the modeling process as a test set to use for validation. The charts labeled "Observed vs. Predicted Frequencies" demonstrate the performance of each model on this sample. Each score is split into deciles and the share of the test set scored in a given range whose actual responses match the dependent variable "yes" or 1 condition is plotted on the y-axis. A strong model will show taller teal bars in the high deciles and shorter bars in the low deciles.
